

SUPPLEMENT S003 TO THE AIRPLANE FLIGHT MANUAL DA 50 C

FLIGHT INTO KNOWN ICING

Doc. No. : 9.01.01-E

Date of Issue of the Supplement : 03-Jun-2022

Design Change Advisory : OÄM 50-011/k

This Supplement to the Airplane Flight Manual has been approved by EASA under Approval No.10079414.

DA 50 C AFM Supplement S003

Intentionally left blank.

1. GENERAL

1.1 INTRODUCTION

This Supplement to the AFM contains all necessary information to operate the ice protection system of the DA 50 C in known icing conditions.

The DA 50 C can be equipped with an optional ice protection system in accordance with the Optional Design Change Advisory OÄM 50-011. It distributes a thin film of ice protection fluid on the wings, vertical stabilizer, horizontal stabilizer, and windscreen. This prevents the formation and accumulation of ice.

An additional electric ice protection system is installed on the propeller, the pitot and stall warning system.

NOTE

The ice protection system is not a "de-icing" system in the usual sense. It can remove only small accumulations of ice. Its main purpose is to *prevent* the accretion of ice (anti-icing).

WARNING

KNOWN ICING CONDITIONS ARE DEFINED BY CS 25/14 CFR PART 25. APPENDIX C. THESE CONDITIONS DO NOT INCLUDE, NOR WERE TESTS CONDUCTED IN, ALL ICING CONDITIONS THAT MAY BE ENCOUNTERED (E.G., FREEZING RAIN, FREEZING DRIZZLE, MIXED PHASE ICING CONDITIONS, OR CONDITIONS DEFINED AS SEVERE). FLIGHT IN THESE CONDITIONS MUST BE AVOIDED. SOME ICING CONDITIONS NOT DEFINED IN CS 25/14 CFR PART 25 HAVE THE POTENTIAL OF PRODUCING HAZARDOUS ICE ACCUMULATIONS. WHICH (1) EXCEED THE CAPABILITIES OF THE AIRPLANE'S ICE PROTECTIONS EQUIPMENT, AND/OR CREATE UNACCEPTABLE **AIRPLANE** PERFORMANCE, INADVERTENT OPERATION IN THESE CONDITIONS MAY BE DETECTED IF ICE FORMS ON THE SIDE AREAS OF THE DOOR WINDOWS. IF THESE CONDITIONS ARE ENCOUNTERED, THE PILOT SHOULD TAKE IMMEDIATE ACTION TO SELECT HIGH/MAX FLOW RATE AND LEAVE THESE CONDITIONS BY CHANGING ALTITUDE, TURNING BACK, OR EVEN CONTINUING ON THE SAME COURSE IF CLEAR AIR IS KNOWN TO BE IMMEDIATELY AHEAD.

1.5 DEFINITIONS AND ABBREVIATIONS

(a) Airspeeds

KTAS: TAS in knots.

(b) Meteorological Terms

De-Ice or De-Icing: The periodic shedding or removal of ice accumulations from a

surface, by destroying the bond between the ice and the protection

surface.

FIKI: Flight into known icing.

Freezing Drizzle: Drizzle is precipitation on the ground or aloft in the form of liquid

water drops that have diameters less than 0.5 mm and greater than 0.05 mm (50 μ m to 500 μ m, 0.002 to 0.02 in). Freezing drizzle is drizzle that exists at air temperatures less than 0 °C or 32 °F (supercooled water), remains in liquid form, and freezes upon

contact with objects on the surface or airborne.

Freezing Rain: Rain is precipitation on the ground or aloft in the form of liquid

water drops which have diameters greater than 0.5 mm (0.02 in). Freezing rain is rain that exists at air temperatures less than zero degrees C (supercooled water), remains in liquid form, and freezes

upon contact with objects on the surface or airborne.

Ice Crystals: Any one of a number of macroscopic, crystalline forms in which

ice appears. Examples are hail and snow.

Icing Conditions: An icing condition is defined as visually detected ice, or the

presence of visible moisture in any form at an indicated outside

air temperature (OAT) of +3 °C (37.4 °F) or below.

LWC: Liquid water content. The total mass of water contained in liquid

drops within a unit volume or mass of air.

Page 9-S003-10	07-Aug-2025	Rev. 3	Doc. No. 9.01.01-E
----------------	-------------	--------	--------------------

Mixed Phase Icing Conditions:

A homogeneous mixture of supercooled water drops and ice

crystals existing within the same cloud environment.

Supercooled Water: Liquid water at a temperature below the freezing point of 0 °C

(32 °F).

(c) Flight Performance and Flight Planning

Continuous Operation:

Typical continuous operations in icing conditions are holding and cruise.

(i) Miscellaneous

CS 25/14 CFR Part 25, Appendix C:

Certification icing condition standard for approving ice protection provisions on airplanes. The conditions are specified in terms of altitude, temperature, LWC, representative droplet size, and cloud

horizontal extent.

ICTS: Ice contaminated tailplane stall.

FPD: Freezing point depressant.

Protected Surface: A surface containing ice protection, typically located at the

surface's leading edge.

TKS: Tecalemit-Kilfrost-Sheepbridge Stokes.

USP: Underspeed Protection System.

■ Doc. No. 9.01.01-E Rev. 3 07-Aug-2025 Page 9-S003-11	I	Doc. No. 9.01.01-E	Rev. 3	07-Aug-2025	Page 9-S003-11

2. OPERATING LIMITATIONS

2.2 AIRSPEED

Airspeed	IAS	Remarks
Minimum airspeed for continuous	94 KIAS	Flaps UP
operation in icing conditions.	79 KIAS	Flaps T/O
	152 KIAS	Flaps UP
Maximum airspeed for continuous operation in icing conditions.	172 KTAS	riaps OF
eperation in reality contained	123 KIAS	Flaps T/O

WARNING

IF MINIMUM ICING SPEED CANNOT BE MAINTAINED, SECTION <u>2.17 - METEOROLOGICAL CONDITIONS</u>
OUTSIDE THE APPROVED ICING CONDITIONS APPLIES.

NOTE

Typical continuous operations in icing conditions are holding and cruise.

2.12 KINDS OF OPERATION

Provided that national operational requirements are met, the following kinds of operation are approved:

Flights into known or forecast icing conditions.

2.14 LIMITATION PLACARDS

DE-ICING FLUID

Max. 31.4 liters (8.3 US gal)
Refer to AFM for approved fluids

Figure 1: Ice Protection Fluid

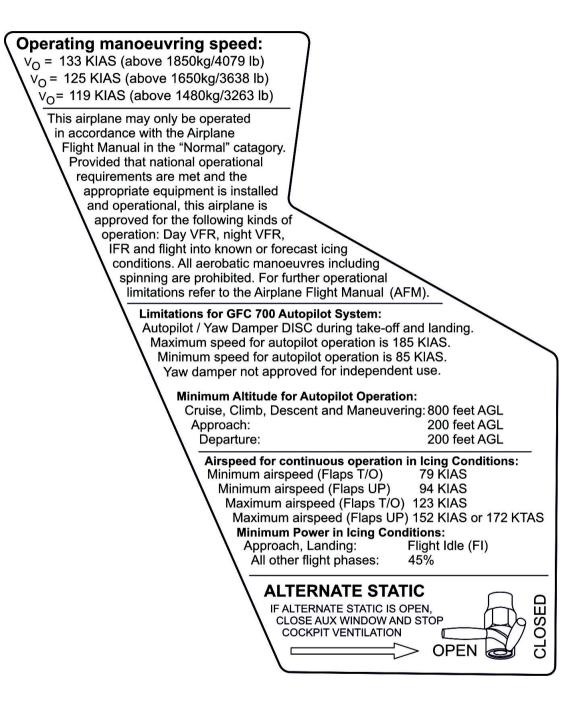

Figure 2: Ice Protection System Speeds Placard

Page 9-S003-14	EASA approved	07-Aug-2025	Rev. 3	Doc. No. 9.01.01-E
----------------	------------------	-------------	--------	--------------------

2.15 OTHER LIMITATIONS

2.15.7 AUTOPILOT LIMITATIONS

Use of the autopilot is prohibited when any ice is observed forming aft of the protected surfaces of the wing, or when unusual lateral trim requirements, or autopilot trim warnings are encountered.

NOTE

The autopilot may mask tactile cues that indicate adverse changes in handling characteristics; therefore, the pilot should consider not using the autopilot when any ice is visible on the airplane, or periodically disconnect the autopilot and check for free movement of all controls (elevator, aileron, and rudder).

Use of autopilot coupled go-around is prohibited during ice encounter and after icing encounter. USP operation has not been tested during or after icing encounter.

2.15.8 OPERATION IN ICING CONDITIONS

General

The DA 50 C is approved for flight into known or forecast icing conditions as defined by CS 25/14 CFR Part 25, Appendix C "Continuous Maximum and Intermittent Icing Envelope", only if the ice protection system is installed and is serviceable.

In icing conditions, the airplane must be operated and its ice protection systems used as described in the operating procedures sections of this manual. Where specific operational speeds and performance information have been established for such conditions, this information must be used.

Doc. No. 9.01.01-E	Rev. 3	07-Aug-2025	EASA	Page 9-S003-15
B00. 110. 0.01.01 E	1101.0	01 7 tag 2020	approved	1 ago o 0000 10

Temperature Limitation

Minimum operation temperature for the ice protection system is -30 °C (-22 °F).

Take-Off

Take-off with ice or snow accumulation, or any frost on the airplane is prohibited.

Flight into Known or Forecast Icing Conditions

Setting flaps to the LDG position is prohibited:

- During flights in icing conditions
- With ice accumulations on any visible surfaces

Setting flap to LDG or T/O is prohibited in case of a failure of the ice protection system.

NOTE

The flaps and landing gear should only be extended and retracted for landing.

Minimum power in icing conditions: 45%

Minimum power in icing conditions during approach and landing: Flight Idle (FI)

Flight Into Known Icing

Minimum Operational Equipment (Serviceable)

Flight into known or forecast icing conditions requires the following equipment to be installed and serviceable:

 Ice protection system installed in accordance with the Optional Design Change Advisory OÄM 50-011.

NOTE

The wing ice inspection lights must be operative prior to flight into known or forecast icing conditions at night. This supersedes any relief provided by the table given in AFM Section 2.12 - Kinds of Operation.

2.16 ICE PROTECTION FLUIDS FOR SYSTEM OPERATION

2.16.1 ICE PROTECTION FLUIDS

WARNING

THE APPROVED ICE PROTECTION FLUIDS ARE HARMFUL. THEY ARE GLYCOL BASED WITH DIFFERENT ADDITIVES. REFER TO THE MATERIAL SAFETY DATA SHEETS FOR PROPER HANDLING, WHICH ARE AVAILABLE FROM THE SUPPLIER OF THE ICE PROTECTION FLUID.

The ice protection fluid must conform to British Specification DTD 406B.

2.16.2 MINIMUM ICE PROTECTION FLUID QUANTITY FOR DISPATCH

The minimum ice protection fluid quantity for dispatch is 6.1 US gal (23 liter).

NOTE

This minimum allows more than 120 minutes of ice protection with NORM selected. The pilot must ensure adequate fluid quantity before each flight.

NOTE

The maximum tank capacity is 8.3 US gal (31.4 liter). The maximum usable tank capacity is 8.2 US gal (31.0 liter).

2.17 METEOROLOGICAL CONDITIONS OUTSIDE THE APPROVED ICING CONDITIONS

2.17.1 FREEZING RAIN / FREEZING DRIZZLE

Flight in meteorological conditions described as freezing rain or freezing drizzle, as determined by the following visual cues, is prohibited:

- Unusually extensive ice accreted on the airframe in areas not normally observed to collect ice.
- Accumulation of ice on the upper surface of the wing aft of the protected area.
- Ice formation on side window areas.
- Visible rain at temperatures below +5 °C (41 °F) OAT.
- Droplets that splash or splatter on impact at temperatures below +5 °C (41 °F) OAT.
- Performance losses larger than normally encountered in icing conditions.

If the airplane encounters conditions that are determined to contain freezing rain or freezing drizzle, the pilot must immediately exit the freezing rain or freezing drizzle conditions by changing altitude, turning back, or even continuing on the same course if clear air is known to be immediately ahead.

2.17.2 MIXED PHASE CONDITIONS

Mixed phase conditions exist when liquid water droplets and ice particles coexist in a region of a cloud. If the airplane encounters conditions that are determined to contain mixed phase / ice crystals, the pilot must immediately exit the conditions by changing altitude, turning back, or even continuing on the same course if clear air is known to be immediately ahead.

NOTE

The prohibition on flight in freezing rain, freezing drizzle or mixed phase conditions is not intended to prohibit purely inadvertent encounters with the specified meteorological conditions; however, pilots should make all reasonable efforts to avoid such encounters and must immediately exit the conditions if they are encountered.

3. EMERGENCY PROCEDURES

3.1 INTRODUCTION

3.1.2 CERTAIN AIRSPEEDS IN EMERGENCIES

If Icing Conditions Do Exist:

Event	KIAS					
Airspeed for emergency landing	Flaps UP	96 KIAS				
with engine off.	Flaps T/O	88 KIAS				

3.5 FAILURES IN THE ELECTRICAL SYSTEM

3.5.1 COMPLETE FAILURE OF THE ELECTRICAL SYSTEM

- 1. Leave the icing area (by changing altitude or turning back or even continuing on the same course if clear air is known to be immediately ahead).
- 2. Proceed in accordance with the procedure given in Section 3.10.1 Complete Failure Of The Electrical System in the main part of the AFM.

NOTE

Switching the ESSENTIAL BUS switch ON removes electrical power from the ice protection system (including stall warning heat and propeller de-ice).

3.7 OTHER EMERGENCIES

3.7.9 ERRONEOUS OR LOSS OF ICE PROTECTION FLUID DISPLAY

If the ice protection fluid quantity is known, the remaining system operating time can be estimated based on the durations given in Section <u>5.3.15 - System Operating Times and Fluid Consumption</u>.

1. Icing conditions leave the icing area as soon as practicable

3.8 ICE PROTECTION SYSTEM EMERGENCIES

3.8.1 FAILURE OF THE ICE PROTECTION SYSTEM

A failure of the ice protection system is any condition in which the system fails to remove ice from protected surfaces, including the propeller, and any system malfunction not covered in the abnormal operating procedures given in Chapter 3A of this supplement.

- AUTOPILOT hold control stick firmly and disengage
- 2. Leave the icing area (by changing altitude, turning back or even continuing on the same course if clear air is known to be immediately ahead).

WARNING

WITH AN INOPERATIVE ICE PROTECTION SYSTEM, SET POWER LEVER TO 90% OR MAX. 2300 RPM, AND LEAVE ICING CONDITIONS AS SOON AS POSSIBLE. IN HEAVY ICING CONDITIONS, IT MAY NOT BE POSSIBLE TO MAINTAIN ALTITUDE OR PROPER GLIDE PATH ON APPROACH; IN THIS CASE, IT IS IMPERATIVE THAT A SAFE AIRSPEED BE MAINTAINED. THE STALL WARNING SYSTEM MAY NOT FUNCTION, AND THERE MAY BE LITTLE OR NO PRE-STALL BUFFETING WITH HEAVY ICE LOADS ON THE WING LEADING EDGES.

3.	Airspeed	 maintain 94 KIAS to 152 KIAS
		or 172 KTAS until landing

CONTINUED

DA 50 C AFM Supplement S003

Before Landing:

4.	FLAPS																U	F	כ

5. Final approach speed:

	up to 1600 kg (3527 lb)	above 1600 kg (3527 lb) up to 1800 kg (3968 lb)	above 1800 kg (3968 lb)
v _{ref} - Flaps UP	86 KIAS	92 KIAS	96 KIAS

3.8.2 INADVERTENT ICING ENCOUNTER, DELAYED ACTIVATION AND EXCESSIVE ICE ACCUMULATION DUE TO OPERATION OUTSIDE APPROVED ICING CONDITIONS

1. DE-ICE HIGH

2. MAX..... press push button

to maximize ice protection

NOTE

The MAX push button activates the maximum possible system flow rate for 120 seconds.

3. PROP DEICE check ON

4. PITOT/STALL HEAT check ON

5. ICE LIGHT..... ON, as required

6. Cabin heat & defrost ON

7. WINDSHIELD press push button as required

If Ice Accretions Are Present on Protected Surfaces

8. Continue with Section 3.8.1 Failure of the Ice Protection System.

If the Protected Surfaces Are Free from Ice Accretions

9. Ice protection fluid level check periodically

10. DE-ICE NORM, HIGH or MAX

as required. Monitor ice build-up.

3.8.3 PROCEDURES FOR EXITING THE FREEZING RAIN/FREEZING DRIZZLE ENVIRONMENT

These procedures are applicable to all flight phases from take-off to landing. Monitor the outside air temperature. While ice may form in freezing drizzle or freezing rain at temperatures as cold as -18 °C (0 °F), increased vigilance is warranted at temperatures around freezing, if visible moisture is present. If the visual cues specified in Section 2.17 - Meteorological Conditions Outside the Approved Icing Conditions for identifying possible freezing rain or freezing drizzle conditions are observed, accomplish the following:

- 1. Exit the freezing rain or freezing drizzle icing conditions immediately, to avoid extended exposure to flight conditions outside of those for which the airplane has been certificated for operation. Asking for priority to leave the area is fully justified under these conditions.
- 2. Activate the ice protection system (DE-ICE, PROP DEICE, PITOT/STALL HEAT, and WINDSHIELD if necessary) if not already active.
- 3. Check that the DE-ICE system is set to HIGH. Activate the DE-ICE system in MAX mode if ice accumulates on or aft of protected surfaces.
- 4. Avoid abrupt and excessive maneuvering that may exacerbate control difficulties.
- 5. Do not engage the autopilot. The autopilot may mask unusual control system forces.
- 6. If the autopilot is engaged, hold the control stick firmly, and disengage the autopilot.
- 7. Periodically move all controls gently to check for and prevent frozen (stuck) control surfaces.
- 8. If an unusual roll response or uncommanded control movement is observed, reduce the angle of attack by increasing airspeed or rolling wings level (if in a turn), and apply additional power, if needed.

CONTINUED

Page 9-S003-26	07-Aug-2025	Rev. 3	Doc. No. 9.01.01-E
----------------	-------------	--------	--------------------

Flight Into Known Icing

- 9. Avoid extending flaps during prolonged operation in icing conditions. Operation with flaps extended can result in a reduced wing angle of attack, with ice forming on the upper surface further aft on the wing than normal, possibly aft of the protected area.
- 10. If the flaps are extended, do not retract them until the airframe is clear of ice.
- 11. Report these weather conditions to air traffic control.

3.8.4 INSUFFICIENT ENGINE POWER IN ICING CONDITIONS

Engine power is less than expected during icing encounter due to blocked intercooler.

- 1. COWL FLAP open
- 2. ALTERNATE AIR..... check open
- 3. Leave icing conditions immediately. (by changing altitude, turning back, or even continuing on the same course if clear air is known to be immediately ahead).

If engine power is insufficient to continue the flight

4. Be prepared for an emergency landing. Proceed in accordance with main AFM Section 3.7.7 - Emergency Landing with Engine Off.

3A. ABNORMAL OPERATING PROCEDURES

3A.1 AIRPLANE-RELATED G1000 NXi CAUTIONS

3A.1.1 CAUTIONS

Caution alerts (amber)	Meaning / Cause
ALTN 1 FAIL	
ALTN 2 FAIL	Engine alternator 1 or 2 has failed.
DEIC PRES LO	De-icing pressure is low.
DEIC PRES HI	De-icing pressure is high.
DEIC LVL LO	Ice protection fluid level is low.
PROP DE-ICE FAIL	Failure of electro thermal propeller de-ice.

3A.1.14 ALTN 1 FAIL / ALTN 2 FAIL

ALTN 1 FAIL ALTN 2 FAIL	Engine alternator 1 or 2 has failed.
----------------------------	--------------------------------------

- 1. Icing Conditions leave the icing area as soon as practicable
- 2. Proceed in accordance with the procedure 3A.1.2 ALTN 1 FAIL or 3A.1.3 ALTN 2 FAIL given in the main AFM.

			· ·		

3A.1.15 DE-ICE PRES LOW

DEIC PRES LO	De-icing pressure is low.							
1. DE-ICE	HIGH							
If DEIC PRES LO Indication	on <u>Does Not Extinguish</u> on the G1000 NXi:							
2. PUMP1 / PUMP2	select other main pump							
	NOTE							
Activate the Notivate the Notivate the Notice	VINDSHIELD pump to prime the alternate main essary.							
If DEIC PRES LO Indication	on <u>Still Does Not Extinguish</u> on the G1000 NXi:							
3. ALTERNATE switch of	on de-ice panel open guard, toggle switch							
If DEIC PRES LO Indication	on Still Does Not Extinguish on the G1000 NXi:							
4. Proceed with Section	3.8.1 - Failure of the Ice Protection System.							

CONTINUED

Page 9-S003-30	07-Aug-2025 Rev. 3	Doc. No. 9.01.01-E

Flight Into Known Icing

If DEIC PRES LO Indication <u>Extinguishes</u> on the G1000 NXi and Normal Operation Is Achieved:

WARNING

IF AT AMBIENT TEMPERATURE ABOVE 10 °C (50 °F) AND BELOW 20 °C (68 °F) DEIC PRES LO WARNING APPEARS IN HIGH MODE, SWITCH TO MAX MODE TO CANCEL THE WARNING.

ABOVE 20 °C (68 °F) AMBIENT TEMPERATURE, WARNING CANCELLATION MAY NOT BE POSSIBLE.

5.	Ice protection system	monitor operation
	Ice protection fluid flow in ALTERNATE similar	r to HIGH mode.
6.	Ice protection fluid level	check periodically

3A.1.16 DE-ICE PRESSURE HIGH

DEIC PRES HI De-icing pressure is high.					
Icing conditions leave the icing area as soon as practicable.					
2. Proceed with Section <u>3.8.1 - Failure of the Ice Protection System</u> .					
NOTE					
Reduced system performance may occur. Unscheduled maintenance is required.					
END OF CHECKLIST					
3A.1.17 DE-ICE LEVEL LOW					
DEICE LVL LO Ice protection fluid level is low.					
Maximum remaining system operating times after first annunciation of the DEICE LVL LO caution message:					
NORM mode					
END OF CHECKLIST					

3A.1.18 PROP DE-ICE FAIL

PROP DE-ICE FAIL

Propeller heat has failed.

NOTE

Reduced system performance may occur. Unscheduled maintenance is required.

NOTE

With a failure of the propeller de-ice system, increased vibrations may occur. In that case, set power lever to 90% or MAX: 2300 RPM to aid de-icing of the propeller and leave the icing conditions as soon as possible

1.	Icing conditions	leave the icing area as soon as
		possible

END OF CHECKLIST

3A.1.19 FAILURE OF INDICATION LIGHTS

The indication lights (MAX, NORM, HIGH) on the de-ice panel are only used to indicate the selected operating mode. Failure to illuminate does not indicate a malfunction of the system.

- 1. Continue flight.
- 2. Unscheduled maintenance is required.

Doc. No. 9.01.01-E	Rev. 3	07-Aug-2025	Page 9-S003-33

3A.1.20 FAILURE OF THE WINDSHIELD DE-ICE

A failure of the windshield de-ice is any condition in which the system fails to remove ice from the windshield.

- 1. Continue flight, viewing through the unobstructed areas on the side of the door windows. Open the emergency window if necessary.
- 2. Use DEFROST to clear light ice formation.
- 3. Leave the icing area as soon as possible.

3A.2 FAILURE IN FLAP OPERATING SYSTEM

3A.2.2 FAILURES IN FLAP OPERATING SYSTEM

Failure in Position Indication or Function

- 1. FLAPS position check visually
- 2. FLAPS switch re-check flap positions

Modified Approach Procedure Depending on the Available Flap Setting

NOTE

Refer to the Landing Distance in Section 5.3.10 - Landing Distances in the main AFM and increase the distances by 30%.

Before Landing, with Ice Accretion on any Visible Surfaces, or if Icing Conditions Do Exist:

	up to 1600 kg (3527 lb)	above 1600 kg (3527 lb) up to 1800 kg (3968 lb)	above 1800 kg (3968 lb)
v _{ref} - Flaps UP	86 KIAS	92 KIAS	96 KIAS

Land at a flat approach angle, use power lever to control airplane speed and rate of descent.

Doc. No. 9.01.01-E	Rev. 3	07-Aug-2025	Page 9-S003-35

4. NORMAL OPERATING PROCEDURES

WARNING

IF ICE IS OBSERVED FORMING AFT OF THE PROTECTED SURFACES OF THE WING, OR IF UNUSUAL LATERAL TRIM REQUIREMENTS, OR IF AUTOPILOT TRIM WARNINGS ARE ENCOUNTERED, DO THE FOLLOWING:

- REDUCE THE ANGLE OF ATTACK BY INCREASING SPEED AS MUCH AS THE AIRPLANE CONFIGURATION AND WEATHER ALLOW, WITHOUT EXCEEDING THE DESIGN MANEUVERING SPEED.
- IF THE AUTOPILOT IS ENGAGED, HOLD THE CONTROL STICK FIRMLY AND DISENGAGE THE AUTOPILOT. DO NOT RE-ENGAGE THE AUTOPILOT UNTIL THE AIRFRAME IS CLEAR OF ICE.
- LEAVE THE ICING AREA IMMEDIATELY BY CHANGING ALTITUDE, TURNING BACK, OR EVEN CONTINUING ON THE SAME COURSE IF CLEAR AIR IS KNOWN TO BE IMMEDIATELY AHEAD.
- IF THE FLAPS ARE EXTENDED, DO NOT RETRACT THEM UNTIL THE AIRFRAME IS CLEAR OF ICE.

WARNING

FLIGHT IN FREEZING RAIN, FREEZING DRIZZLE, OR MIXED PHASE ICING CONDITIONS (SUPERCOOLED WATER AND ICE CRYSTALS) MAY RESULT IN HAZARDOUS ICE BUILD-UP ON PROTECTED SURFACES EXCEEDING THE CAPABILITY OF THE ICE PROTECTION SYSTEM, OR MAY RESULT IN ICE FORMING AFT OF THE PROTECTED SURFACES. THIS ICE MAY NOT BE SHED USING THE ICE PROTECTION SYSTEMS, AND IT MAY SERIOUSLY DEGRADE THE PERFORMANCE AND CONTROLLABILITY OF THE AIRPLANE.

WARNING

THE AUTOPILOT WILL NOT MAINTAIN AIRSPEED WITH ICE ON THE AIRPLANE. MONITOR SPEED CLOSELY.

CAUTION

DO NOT DELAY ACTIVATION OF THE ICE PROTECTION SYSTEM, IF ICING CONDITIONS ARE ENCOUNTERED. THE SYSTEM MUST BE ACTIVATED PRIOR TO ACCUMULATION OF ICE ON PROTECTED SURFACES.

Identification of Icing Conditions

The following indication shall be used to identify icing conditions:

Visible moisture at or below an indicated outside air temperature of +5 °C (41 °F).

Identification of Freezing Rain/Freezing Drizzle Icing Conditions

The following shall be used to identify freezing rain/freezing drizzle icing conditions:

- (1) Unusually extensive ice accreted on the airframe in areas not normally observed to collect ice.
- (2) Accumulation of ice on the upper surface of the wing, aft of the protected area.
- (3) Ice accretion on the side window areas.

Visible moisture at or below an indicated outside air temperature of +5 °C (41 °F).

Identification of Possible Freezing Rain/Freezing Drizzle Conditions

The following may be used to identify possible freezing rain/freezing drizzle conditions:

- (1) Visible rain at temperatures below +5 °C (41 °F) outside air temperature (OAT).
- (2) Droplets that splash or splatter on impact at temperatures below +5 °C (41 °F) OAT.
- (3) Performance losses larger than normally encountered in icing conditions. It is possible to experience severe ice accretions not visible to the flight crew, such as wing lower surface accretion or propeller blade accretion.

NOTE

Procedures for exiting freezing rain/freezing drizzle conditions are given in Section <u>3.8.3</u> - <u>Procedures for Exiting the Freezing Rain/ Freezing Drizzle Environment</u>.

Page 9-S003-38	07-Aug-2025 Rev. 3	Doc. No. 9.01.01-E

Flight Into Known Icing

Propeller Vibration

Asymmetric ice shedding from the propeller blades may result in vibrations. Increasing the propeller RPM by increasing the power may help the shedding of the remaining ice. As not all icing conditions are predictable, the propeller vibration may not cease in all cases.

Holding in Icing Conditions

Holding in icing conditions for longer than 45 minutes may reduce margins and could result in inadequate handling and control characteristics.

4.2 AIRSPEEDS FOR NORMAL OPERATING PROCEDURES

With Ice Accumulation on the Unprotected Surfaces of the Airplane or if Icing Conditions Do Exist:

Flight Mass	up to 1600 kg (3527 lb)	above 1600 kg (3527 lb) up to 1800 kg (3968 lb)	above 1800 kg (3968 lb)
Airspeed for cruise climb (Flaps UP)		96 KIAS	
Approach speed for normal landing (Flaps UP)	86 KIAS	92 KIAS	96 KIAS
Approach speed for normal landing (Flaps T/O)	80 KIAS	84 KIAS	88 KIAS
Minimum speed during go-around (Flaps T/O)	80 KIAS	84 KIAS	88 KIAS

4.5 CHECKLISTS FOR NORMAL OPERATING PROCEDURES

CAUTION

IT IS EXTREMELY IMPORTANT TO VISUALLY INSPECT EACH TKS PANEL FOR PROPER FLUID DISTRIBUTION ACROSS THE ACTIVE AREA OF EACH PANEL PRIOR TO FLIGHT INTO KNOWN ICING.

4.5.1 PRE-FLIGHT INSPECTION

I. Cabin Check

Ice Protection System:

a)	ELECT. MASTER	ON
b)	ICE PROTECTION FLUID	check quantity
c)	Doore	closed

WARNING

ICE PROTECTION FLUIDS ARE HARMFUL. FOR PROPER HANDLING, REFER TO THE MATERIAL SAFETY DATA SHEETS, WHICH ARE AVAILABLE FROM THE SUPPLIER OF THE ICE PROTECTION FLUID.

d)	WINDSHIELD	press push button
e)	Spraynozzles	evidence of ice protection fluid

■ Doc. No. 9.01.01-E Rev. 3 07-Aug-2025 Page 9-S003-41	ı	Doc. No. 9.01.01-E	Rev. 3	07-Aug-2025	Page 9-S003-41
--	---	--------------------	--------	-------------	----------------

NOTE

If the system has been inoperative for a while, has been drained, or has run dry, trapped air - suspected in the feeder lines to the main pumps - can be removed from the feeder lines to the main pumps by activating the windshield pump several times.

NOTE

Do not operate the main pumps with an empty ice protection fluid tank. Operating the main system pumps with an empty ice protection fluid tank can cause a future system malfunction. To reestablish full system function, special maintenance action is required.

NOTE

The ANNUN-TEST mode activates the DEICE LVL LO caution immediately if the ice protection fluid quantity is low, and activates the DEIC PRES LO caution after 120 seconds.

f)	ANNUN-TEST	ON
g)	DEIC PRES HI	verify NOT ILLUMINATED
h)	DEICE LVL LO	check (must be annunciated if
		ice protection fluid quantity is
		below 7.0 liter (1.9 US gal))
	Wait for minimum 120 seconds.	
i)	DEIC PRES LO	check, ILLUMINATED

Page 9-S003-42 07-Aug-2025 Rev. 3 Doc. No. 9.01.01-E	Page 9-S003-42	07-Aug-2025	Rev. 3	Doc. No. 9.01.01-E
--	----------------	-------------	--------	--------------------

Flight Into Known Icing

j)	ANNUN-TEST	OFF
k)	ALTERNATE	ON
l)	Porous panels on wings	Evidence of ice protection fluid
m)	ALTERNATE	OFF
n)	PUMP 2	select
o)	DE-ICE	HIGH
	Wait for 120 seconds.	
p)	DEIC PRES LO	verify NOT ILLUMINATED
		refer to NOTE below.

NOTE

The ice protection system is approved for operation with ice protection fluid that has a very temperature dependant viscosity characteristic. The viscosity decreases with rising temperature above 0 °C (32 °F) and passes through the porous membrane of the panels with less resistance. This decrease in pressure drop reduces the pressure in the panel reservoir, which may not be adequate to wet-out the entire panel active area if the preflight inspection is performed at warmer outside temperatures.

NOTE

If at ambient temperatures above 10 °C (50 °F) and below 20 °C (68 °F) DEIC PRES LO warning appears in HIGH mode, switch to MAX mode to cancel the warning. Above 20 °C (68 °F) ambient temperature, warning cancellation may not be possible.

END OF CHECKLIST

II. Walk-Around Check, Visual Inspection

Ice Protection System:

CAUTION

IT IS EXTREMELY IMPORTANT TO VISUALLY INSPECT EACH TKS PANEL FOR PROPER FLUID DISTRIBUTION ACROSS THE ACTIVE AREA OF EACH PANEL PRIOR TO FLIGHT INTO KNOWN ICING.

a)	Ice protection fluid tank	visually check quantity through	
		filler cap	
b)	Filler cap	secure	

Page 9-S003-44	07-Aug-2025	Rev. 3	Doc. No. 9.01.01-E	

Flight Into Known Icing

c) Spraynozzles	•
NOTE	
If required, activate DE-ICE on MAX un entire porous panel active area.	itil fluid is evident along
e) Porous panels on horizontal and vertical tail.	visually check no damage and no holes blocked, evidence of ice protection fluid along entire porous panel active area
f) Propeller heating pads	visually check no damage
g) Wing, tail, propeller, windshield	verify free from ice
END OF CHECKLIST	
4.5.4 BEFORE TAXIING	
a) PROP DEICE	ON
b) PROP DE-ICE FAIL	
c) PROP DEICE	UFF
END OF CHECKLIST	

4.5.5 TAXIING

NOTE

Ice protection fluid will remain on the windshield for a while after operating windshield de-ice. For an unobstructed view, do not operate the windshield de-ice during taxi.

4.5.7 AFTER TAKE-OFF

Activate the ice protection system sufficiently in advance of entry in icing conditions.

1.	DE-ICE	NORM
2.	PROP DEICE	ON
3.	PITOT/STALL HEAT	ON
4.	ICE LIGHT	ON, as required
5.	Cabin heat & defrost	ON

END OF CHECKLIST

4.5.8 CLIMB

Before entering icing conditions, or if icing conditions do exist:

1.	DE-ICE	. NORM, monitor ice build-up
		HIGH if ice accretes on protected areas
		MAX if ice accretes on protected
		areas in HIGH mode.

Page 9-S003-46	07-Aug-2025	Rev. 3	Doc. No. 9.01.01-E
----------------	-------------	--------	--------------------

NOTE

The MAX push button activates the maximum possible system flow rate for 120 seconds.

2. PROP DEICE ON

3. PITOT/STALL HEAT check ON

If Ice Accretes in MAX Mode:

Proceed with Section <u>3.8.2 - Inadvertent Icing Encounter</u>, <u>Delay Activation and Excessive Ice Accumulation due to Operation Outside Approved Icing Conditions</u>.

While in Icing Conditions:

	5.	Airspeed	maintain 94 KIAS (Flaps UP)
	6.	PROP DEICE	check ON
	7.	PITOT/STALL HEAT	check ON
	8.	ICE LIGHT	ON, as required
	9.	Cabin heat & defrost	check ON
1	0.	WINDSHIELD	press push button, as required

WARNING

WHEN DISCONNECTING THE AUTOPILOT WITH ICE ACCRETIONS ON THE AIRPLANE, THE PILOT SHOULD BE ALERT FOR OUT-OF-TRIM FORCES. PILOT CONTROL STICK INPUT SHOULD BE APPLIED AS REQUIRED TO PREVENT POTENTIAL UNDESIRED FLIGHT PATH DEVIATIONS.

ı	Doc. No. 9.01.01-E	Rev. 3	07-Aug-2025	Page 9-S003-47	
		i			

DA 50 C AFM Supplement S003

11. Ice protection fluid level check periodically

NOTE

Ice shedding from the propeller may result in elevated vibration. These vibrations stop, once ice is shedded from all propeller blades equally. Increasing the propeller RPM can assist in ice shedding.

NOTE

The autopilot may be used in icing conditions. However, every 10-15 minutes, the autopilot should be disconnected to detect any out-of-trim conditions caused by ice build-up on unprotected surfaces. If significant out-of-trim conditions are detected, the autopilot must remain off for the remainder of the icing encounter so that the pilot may monitor for additional force build-up.

After Leaving Icing Conditions:

12.	DE-ICE	OFF
13.	PITOT/STALL HEAT	OFF, as required
14.	PROP DEICE	OFF, as required
15.	ICE LIGHT	OFF, as required
16.	Cabin heat & defrost	OFF, as required

4.5.9 CRUISE

Before Entering Icing Conditions, or if Icing Conditions Do Exist:

1. DE-ICE NORM, monitor ice build-up

HIGH if ice accretes on protected areas

MAX if ice accretes on protected

areas in HIGH mode.

2. PROP DEICE ON

3. PITOT/STALL HEAT check ON

If Ice Accretes on Protected Surfaces in MAX Mode:

4. Proceed with Section <u>3.8.1 - Failure of the Ice Protection System</u>. *While in Icing Conditions:*

5. PROP DEICE check ON

6. PITOT/STALL HEAT check ON

7. ICE LIGHT..... ON, as required

8. Cabin heat & defrost check ON

9. WINDSHIELD press push button, as required

10. Ice protection fluid level check periodically

11. POWER lever minimum 45%

WARNING

WHEN DISCONNECTING THE AUTOPILOT WITH ICE ACCRETIONS ON THE AIRPLANE, THE PILOT SHOULD BE ALERT FOR OUT-OF-TRIM FORCES. PILOT CONTROL STICK INPUT SHOULD BE APPLIED AS REQUIRED TO PREVENT POTENTIAL UNDESIRED FLIGHT PATH DEVIATIONS.

NOTE

Ice shedding from the propeller may result in elevated vibration. These vibrations stop, once ice is shedded from all propeller blades equally. Increasing the propeller RPM can assist in ice shedding.

NOTE

The autopilot may be used in icing conditions. However, every 10-15 minutes, the autopilot should be disconnected to detect any out-of-trim conditions caused by ice build-up on unprotected surfaces. If significant out-of-trim conditions are detected, the autopilot must remain off for the remainder of the icing encounter so that the pilot may monitor for additional force build-up.

12.	Airspeed	maintain 94 KIAS to 152 KIAS
		or 172 KTAS
Afte	r Leaving Icing Conditions:	
9.	DE-ICE	OFF
10.	PITOT/STALL HEAT	OFF, as required
11.	PROP DEICE	OFF, as required
13.	ICE LIGHT	OFF, as required
12.	Cabin heat & defrost	OFF, as required

4.5.13 GO AROUND

CAUTION

THE STALL WARNING SCHEDULE MAY BE REVERTED TO THE NON ICING SCHEDULE DURING A BALKED LANDING WITH POSSIBLE GROUND CONTACT OF THE WHEELS FOLLOWING A FLIGHT IN ICING CONDITIONS. TO ENSURE PROPER MARGINS FOR STALL WARNING IN THIS CASE, THE PILOT SHALL ACTIVATE THE AIRFRAME ICE PROTECTION SYSTEM FOR A SHORT TIME DURING GO AROUND WHEN IT IS ENSURED ALL WHEELS HAVE NO GROUND CONTACT.

Doc. No. 9.01.01-E	Rev. 3	07-Aug-2025	Page 9-S003-53

4.5.14 AFTER LANDING

1.	DE-ICE	OFF
2.	PROP DEICE	OFF
3.	PITOT/STALL HEAT	OFF
4.	ICE LIGHT	OFF

END OF CHECKLIST

4.5.16 EXIT AIRPLANE

CAUTION

WHEN THE ICE PROTECTION SYSTEM HAS BEEN ENABLED IN FLIGHT, THE WALKWAYS ON THE INNER WINGS MAY BE SLIPPERY.

4.5.18 PARKING

WARNING

ICE PROTECTION FLUIDS ARE HARMFUL. FOR PROPER HANDLING, REFER TO THE MATERIAL SAFETY DATA SHEETS, WHICH ARE AVAILABLE FROM THE SUPPLIER OF THE ICE PROTECTION FLUID.

NOTE

When the ice protection system has been enabled in flight, special care must be taken when touching the airframe structure or doors, as they may be partially contaminated with ice protection fluid. Clean the ice protection fluid from the porous panels. Refer to Chapter 8 - Airplane Handling, Care and Maintenance for appropriate procedures.

5. PERFORMANCE

5.1 INTRODUCTION

Airplane performance and stall speeds in clear air are unchanged with the installation of the ice protection system.

Significant climb and cruise performance degradation, range reduction, as well as buffet and stalling speed increase must be expected if ice accumulates on the airframe.

Ice accretions on the protected surfaces can cause noticeable performance losses beyond those stated in this section.

5.3 PERFORMANCE TABLES AND DIAGRAMS

The performance data in this supplement is valid for ice accumulation on unprotected surfaces in the maximum continuous icing conditions defined by CS 25/14 CFR Part 25, Appendix C.

NOTE

Known icing conditions are defined by CS 25/14 CFR Part 25, Appendix C. These conditions do not include, nor were tests conducted in all icing conditions that may be encountered (e.g. supercooled clouds, freezing rain, freezing drizzle, mixed phase icing conditions, or conditions defined as severe). Flight in these conditions must be avoided. Some icing conditions not defined in CS 25/14 CFR part 25 have the potential of producing hazardous ice accumulations, which (1) exceed the capabilities of the airplane's ice protection equipment, and/or (2) create unacceptable airplane performance.

5.3.10 LANDING DISTANCES

With Ice Accumulation on the Unprotected Surfaces of the Airplane, or if Icing Conditions Do Exist:

- Power lever Flight Idle (FI)

- Flaps..... T/O

Use the abnormal flap position information from the main part of the AFM.

5.3.15 SYSTEM OPERATING TIMES AND FLUID CONSUMPTION

The maximum system fluid consumption and operation times with the maximum usable quantity of ice protection fluid is:

NORM mode: max. 3 US gal/h (11.3 L/h) : 2 hrs. 44 min.

HIGH mode: max. 6 US gal/h (22.6 L/h) : 1 hr. 22 min.

The ice protection fluid consumption per activation is:

MAX mode: 0.4 US gal (1.5 L)

WINDSHIELD: 1.5 fl. oz. (40 mL)

6. MASS AND BALANCE

6.4 FLIGHT MASS AND CENTER OF GRAVITY

6.4.1 MOMENT ARMS

Itam	Lever Arm		
ltem	[m]	[in]	
Ice protection fluid tank	3.945	155.3	

The mass (weight) of the ice protection fluid is obtained as follows:

- Multiply the fluid quantity in liters by 1.1 to obtain kilograms (kg), or
- Multiply the fluid quantity in US gallons by 9.2 to obtain pounds (lb), or
- Multiply the fluid quantity in US gallons by 4.16 to obtain kilograms (kg)

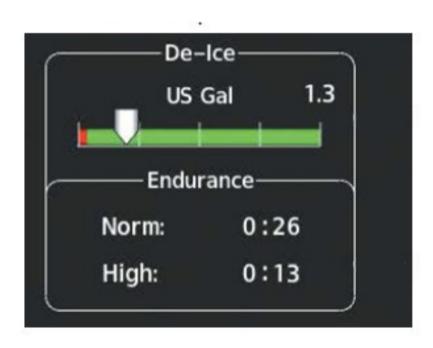

7. DESCRIPTION OF THE AIRPLANE AND ITS SYSTEMS

7.8 POWER PLANT

7.8.4 ENGINE INSTRUMENTS

On the Garmin G1000 NXi MFD the ice protection fluid level indication is displayed on the engine page. Indication markings indicate (from left to right) 1/4, 1/2, 3/4 and full of the maximum fluid quantity of 8.3 US gal (31.4 liter).

Display when pushing the ENGINE softkey:

7.9 ELECTRICAL SYSTEM

7.9.3 WARNING, CAUTION AND ADVISORY MESSAGES

Caution Alerts on the G1000 NXi

Caution alerts (amber)	Meaning / Cause	
DEIC PRES LO	System pressure upstream of the porous panels on the horizontal, vertical tail or RH wing is too low.	
DEIC PRES HI	System pressure upstream of the ice protection fluid filter is too high.	
DEIC LVL LO	Ice protection fluid level in the tank is below 1.85 US gal (7 liter).	
PROP DE-ICE FAIL	Failure of electrothermal propeller de-ice.	

7.16 DE-ICING SYSTEM

7.16.1 AIRFRAME AND WINDSHIELD ICE PROTECTION SYSTEM

Description

The ice protection system is electrically operated. It is supplied with power via the DE-ICE circuit breaker. The airframe and windshield IPS is fluid based and a so called Tecalemit-Kilfrost-Sheepbridge Stokes (TKS) system whereby a fluid acts as a freezing point depressant (FPD).

Airframe Ice Protection System

The fluid is distributed via a tubing system to each part of the aircraft structure (fuselage, wing, tail) necessary to be protected by preventing ice accretion during flight in FIKI condition. The core of the system are porous panels located on the leading edge of protected surfaces that are used to distribute the fluid to the skin of each surface. The fluid mixes with the accreting ice or freezing water decreasing the freezing point and therefore preventing formation and accretion of ice.

Windshield Ice Protection System

The windshield ice protection system consists of two spray nozzles that, on demand, spray fluid to the lower portions of the windshield. The fluid soaks into potential ice on the windshield and depresses the freezing point so the ice becomes liquid and is removed by aerodynamic forces.

Overview

For the overview of the mechanical systems refer to Figure 1, for the overview of the electrical system refer to Figure 2.

Both systems draw fluid from a common tank.

Page 9-S003-66	07-Aug-2025 Rev. 3	Doc. No. 9.01.01-E

	_	

Flight Into Known Icing

The airframe ice protection system consists of the following main components:

- lce protection fluid tank with an integrated filler neck, which has an inlet strainer.
 The tank has a maximum capacity of 8.3 US gal (31.4 liters), a useable volume of 8.2 US gal (31 liters) and is located within the aircraft fuselage in a designated compartment behind the rear seats.
 - The ice protection fluid is glycol-based. It has an approx. mass density of 9.2 lb/US gal (4.16 kg/US gal / 1.1 kg/liter). A fluid level gauge provides data for ice protection fluid level indication on the G1000 NXi System.
 - An independent low level sensor in the tank provides indication of low fluid level (below 1.85 US gal / 7 liter).
- Two main pumps, installed under a cover next to the ice protection fluid tank. The
 pumps take ice protection fluid from the tank and feed it to the airframe ice
 protection system (see below).
 - In the NORM mode both main pumps run simultaneously and are cycled on and off by the control box.
 - In the HIGH mode only the selected main pump runs continuously.
 - In the MAX mode both pumps run simultaneously and continuously for a duration of two minutes. The operation of the ice protection system is described below.
- One high pressure switch, installed between the metering pumps and the filter to identify high pressure conditions upstream the filter. Refer to Section 7.9.3 - Warning, Caution and Advisory Messages.
- The ice protection fluid filter, installed next to the main pumps. The active main pump feeds the ice protection fluid through the filter to the proportioning units.
 The filters prevent the proportioning units from contamination.

- Proportioning units for wing panels (in the LH and RH center wing) and for the empennage (in the upper vertical tail). The proportioning units regulate the flow of ice protection fluid to the porous panels by means of capillaries.
- Four low pressure sensors which detect malfunctions of the system. Refer to Section 7.9.3 - Warning, Caution and Advisory Messages.
- Porous Titanium panels are fitted to the leading edge of the wings, the vertical tail, and the horizontal tail. Each panel contains a porous membrane and a cavity along the porous front plate (active area) that serves as a reservoir. The porous panels weep the fluid at a low rate through fine holes.

Windshield Ice Protection System - Main Components

The windshield ice protection system consists of:

- One windshield de-icing pump with solenoid valve, installed in the middle tunnel between the pilot and co-pilot seat under an inspection lid on the LH side. The windshield de-icing pump supplies the fluid to spray nozzles.
- Two de-icing fluid spray nozzles for the windshield.

Flight Into Known Icing

Electrical Systems of Airframe and Windshield Ice Protection System - Main Components

The electrical system of the airframe and windshield IPS consists of:

- An ice protection control box which is mounted next to the main pumps. The ice protection control box contains all necessary relays to operate and cycle the pumps.
- A de-ice panel, mounted on the LH side of the instrument panel, enables the complete control of the whole ice protection system.
- Two ice lights, one for each wing, are installed in the LH and RH doors to enable the pilot to identify icing conditions and to monitor adequate system performance on the wings in low lighting conditions.

Operation

The TKS airframe IPS is operated as anti ice system and must be activated if the aircraft is operated in visual moisture at an OAT lower than +5 °C (41 °F).

NOTE

The ice schedule of the stall warning system is automatically activated by the first activation of the airframe ice protection system if the wheels are off ground. Refer to Stall Warning lce Scheduling for a detailed description of the stall warning icing schedule.

The airframe ice protection system operation is designed for three different modes to be used depending on the severity of the icing conditions. The Normal, High and Max mode described below.

Operation and choice of system mode is done through four toggle switches and two push buttons located on the ice protection control unit in the LH section of the instrument panel. Refer to Figure 3.

ı	Doc. No. 9.01.01-E	Rev. 3	07-Aug-2025	Page 9-S003-71	

The current operating mode is indicated by the following indication lights:

NORM : lower white light only

HIGH : center amber light only

MAX : both (top and center) amber lights

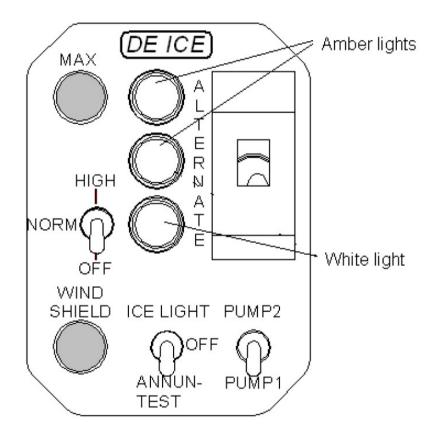

Figure 3: Ice Protection Control Unit

Page 9-S003-72	07-Aug-2025 Rev. 3	Doc. No. 9.01.01-E
	· ·	

OFF/NORM/HIGH Switch

The OFF/NORM/HIGH activates the airframe ice protection system and allows choice of the two constant system modes as described below.

Down position: Airframe IPS OFF.

Center position: The NORMAL mode is cycled 30 seconds active, 90 seconds inactive with both pumps in use resulting in 50% average design flowrate. The mode is to be used for the often encountered, but not very severe continuous maximum icing conditions. The NORMAL mode is selected when icing conditions (visible moisture and OAT < 5°C) are encountered and prior to ice formation. Maximum system fluid consumption is 3 US gal/h (11.3 liter/h). Conservative maximum system operating time is 2 hrs. 44 min.

Up position:

The HIGH mode is a constant mode with one (voted) metering pump active providing a constant flow rate. This mode is also called the "design mode" or 100% mode being reference for all design flow and pressure calculations. This mode is designed to cover all continuous maximum and most of the intermittent maximum icing conditions as defined by FAR 25 Appendix C, and is selected when icing conditions are more demanding. Maximum system fluid consumption is 6 US gal (22.6 liter/h). Conservative maximum system operating time is 1 hrs. 22 min.

MAX Push Button

The upper push button activates the MAX mode of the ice protection system when the system is presently in the HIGH mode.

DA 50 C AFM Supplement S003

The MAX mode can be activated for 120 seconds having both metering pumps active providing a 200% design flowrate. This mode is used in case the HIGH mode is not sufficient for complete anti ice as are severe intermittent max encounters. Additionally, the MAX mode provides limited de-ice capabilities in case of delayed activation or conditions outside the envelope. Each activation consumes 0.4 US gal (1.5 liter).

PUMP1/PUMP2 Switch

A switch on the RH lower side of the IPS control panel selects one of the two main pumps if HIGH Mode is active.

ALTERNATE Switch

The ALTERNATE switch connects the main pump no. 2 directly to the ESSENTIAL BUS. Thus, in case of a total power loss of the main bus in icing conditions, operation of the ice protection system similar to the HIGH mode is possible.

ANNUN-TEST/OFF/ICE LIGHT

This switch activates the ice-lights or the annunciation test procedure. Refer to Section 4.6.1 - Pre-Flight Inspection - I. Cabin Check.

Replenishing

Refer to Section 2.16.1 - Ice Protection Fluids for approved ice protection fluids.

NOTE

The ice protection fluid must be considered for the mass and balance calculations. Refer to Section <u>6.4.1 - Moment Arms</u>.

Ice protection fluid is replenished through the filler which is located on the right hand side of the fuselage. The tank has a maximum capacity of 8.3 US gal (31.4 liter) and a usable capacity of 8.2 US gal (31 liter).

Page 9-S003-74	07-Aug-2025 Rev. 3	Doc. No. 9.01.01-E

Flight Into Known Icing

Stall Warning Ice Scheduling

Icing of aerodynamic surfaces can lead to an increase of the stall speed. Ice on unprotected surfaces might remain even after exit of the icing conditions.

To guarantee proper margin of the audible stall warning during a flight in, or following icing conditions, the stall warning automatically switches to an icing schedule upon activation of the airframe ice protection system (TKS). Due to possible residual ice accumulations on unprotected surfaces, the stall warning is latched in the icing schedule for the remainder of the flight, also after deactivation of the airframe ice protection system (TKS).

After deactivation of the airframe ice protection system, the icing schedule is reverted to the non-icing schedule, only when the wheels have contact with the ground (Weight on Wheels).

CAUTION

THE STALL WARNING SCHEDULE MAY BE REVERTED TO THE NON ICING SCHEDULE DURING A BALKED LANDING WITH POSSIBLE GROUND CONTACT OF THE WHEELS FOLLOWING A FLIGHT IN ICING CONDITIONS. TO ENSURE PROPER MARGINS FOR STALL WARNING IN THIS CASE, THE PILOT SHALL ACTIVATE THE AIRFRAME ICE PROTECTION SYSTEM FOR A SHORT TIME DURING GO AROUND WHEN IT IS ENSURED ALL WHEELS HAVE NO GROUND CONTACT.

7.16.2 PROPELLER ICE PROTECTION SYSTEM

Description

The electric propeller ice protection system functions on the principle of electric heating de-ice boots on the inner sections of the propeller. The heated pads increase the surface temperature of the propeller and reduce adhesion of ice, thus ice accumulating on the propeller blades when operating in icing conditions is periodically shedded due to centrifugal forces.

The ice protection system of the propeller is activated via an ON/OFF switch in the cockpit which supplies power from Alternator 2 bus to the timer box and a relay if the engine is running. Based on the outside air temperature the relay bypasses the timer box at temperatures below -10 °C (14 °F). The timed mode is required to prevent electric boots from overheating during ground use or at high OATs.

The power is transferred via electric brushes located on the mounting bracket at the front of the engine to a slip ring which is connected to the electrothermal de-icer boot on each propeller blade.

The current supplied to the brushes is measured and triggers the CAS message PROP DE-ICE FAIL of the Garmin 1000 NXi in case of low amperage. Refer to Section 7.9.3 - Warning, Caution and Advisory Messages.

Propeller Ice Protection System - Main Components

The propeller ice protection system consists of the following main components:

- an electric timer box including an electric bypass
- a brush block assembly
- a slip ring assembly
- 3 propeller electrothermal de-icers with tapered heating distribution

Page 9-S003-76	07-Aug-2025	Rev. 3	Doc. No. 9.01.01-E
----------------	-------------	--------	--------------------

Flight Into Known Icing

Operation

The propeller ice protection system must be activated if the aircraft is operated in visible moisture at or below an indicated outside air temperature of +5°C (41 °F).

The propeller ice protection system of the propeller is activated via the PROP DE-ICE switch in the cockpit which supplies power from Alternator 2 bus to the timer box and a relay if the engine is running. The switch is located on the lower left side of the I-panel.

Activation of the propeller de-ice is indicated by the Garmin G1000 NXi via the annunciation PROP DE-ICE ON.

8. AIRPLANE HANDLING, CARE AND MAINTENANCE

The porous panels can be cleaned with soap and water using a clean, lint-free cloth. Isopropyl alcohol, ethyl alcohol, or methylated spirit may be used to remove oil or grease. Furthermore, approved ice protection fluids, AVGAS, and jet fuel are permitted for use on the panels. For further information, refer to Airplane Maintenance Manual Chapter 30.

WARNING

ICE PROTECTION FLUIDS ARE HARMFUL. FOR PROPER HANDLING, REFER TO THE MATERIAL SAFETY DATA SHEETS, WHICH ARE AVAILABLE FROM THE SUPPLIER OF THE ICE PROTECTION FLUID.

CAUTION

DO NOT APPLY POLISH OR WAX TO THE PANELS. CERTAIN SOLVENTS, PARTICULARLY METHYL ETHYL KETONE (MEK), ACETONE, LACQUER THINNER, AND OTHER TYPES OF THINNERS AND SOLVENTS DAMAGE THE INNER MEMBRANE OF THE PANELS. MASK ACTIVE AREA OF PANELS WITH A LOW TACK TAPE WHEN USING SOLVENTS, OR PAINTING THE AIRPLANE IN THE PROXIMITY OF THE PANELS, OR WHEN THE AIRPLANE IS STORED IN A DUSTY ENVIRONMENT.

NOTE

The ice protection system should be checked for excessive ice protection fluid leaks after each use. Due to the dihedral, small amounts of ice protection fluid can exit from the inner wing panels over a period of several days. Contamination precautions must be taken if the airplane is stored in a hangar.

8.6 CLEANING AND CARE

8.6.6. PROLONGED OUT OF SERVICE OR DE-ICING SYSTEM RUN DRY

To avoid the need to reprime the system, and to provide a quick response when returned to service, maintain at least 0.5 US gal (2 liters) in the tank. To ensure that all system components are filled with fluid, operate the system at least once a month. If necessary, operate the pumps until all air is purged from components and pipelines.

Priming of the Main Pumps

The main pumps may not be self priming and are primed, when required, by the operation of either windshield pump. The windshield pump will prime main pump 1 or 2.

8.6.7 REPLENISHMENT OF THE ICE PROTECTION FLUID TANK

For approved ice protection fluids, refer to Section 2.16.1 - Ice Protection Fluids.

The ice protection fluid tank is located within the aircraft fuselage in a designated compartment behind the rear seats. The tank is connected to an external filler cap, mounted flush on the right hand side of the fuselage above the tank installation.

Always clean the filler of the fluid tank before replenishing. Secure the filler cap immediately after replenishment.
